Work Experience

Software Engineer, CGI/BJSS, Leeds, UK

Jan 2022 – Present

Client: Scottish Water Retailer (via CGI) - Sep 2025 - Ongoing

Project: Huxley

- Contributed to a cloud-based data platform hosted on Azure, supporting tariff, billing, and invoicing operations for a UK utilities retailer.
- Developed and optimized SQL Server stored procedures for high-volume data ingestion and processing, including tariff calculations, invoice generation, billing workflows, and data issue triage.
- Improved database performance through index design, query tuning, and execution plan analysis.
- Built PowerShell tools to support testing, validation, and operational tasks across the data pipeline.
- Participated in code reviews, ensuring adherence to team standards and performance best practices.
- Worked with source control hosted on GitHub, integrated with Azure-based services and deployment workflows.
- Supported Azure Functions, driven data workflows, collaborating with services implemented in Python and Node.js, with primary responsibility on the SQL layer.

Client: Major UK Gambling Operator (via BJSS) - Jan 2022 - Sep 2025

Supported a regulated UK gambling organisation operating a large on-premises SQL Server estate, undertaking a phased transition toward cloud and multi-cloud platforms while modernising legacy applications. The environment included business-critical SSRS reporting for regulatory and marketing teams, requiring uninterrupted availability throughout the migration.

Project: Data Distribution - Mar 2024 - Sep 2025

- Worked closely with client engineers to diagnose and resolve data inconsistencies
- Developed, enhanced, and maintained high-volume, complex SSRS reports supporting regulatory and commercial reporting
- Refactored stored procedures, views, and SQL Agent jobs to support migration initiatives and evolving business requirements
- Extended stored procedures to query GCP-linked servers, enabling hybrid on-prem and cloud data access
- Migrated selected SQL Server stored procedure logic to GCP BigQuery, retaining SSRS reports via ODBC-linked datasets
- Generated on-demand CSV and Excel reports using PowerShell and C#

Project: Backoffice Members - Jan 2022 - Mar 2024

- Extracted business logic and database access into ASP.NET Core Web APIs, reducing direct coupling between applications and the database layer
- Refactored stored procedures, views, and SQL Agent jobs to support application modernisation and migration objectives

- Ported and maintained legacy WinForms applications into ASP.NET, Razor, and React-based web applications using JavaScript and jQuery
- Conducted peer code reviews, approved release tickets, and upheld development standards
- Mentored new team members and client engineers
- Authored and maintained technical documentation on internal TechWiki / Confluence platforms
- Collaborated closely with QA teams to validate features, troubleshoot defects, and ensure functional correctness

.NET Developer, Vismo, York, UK **Aug 2020 – Jan 2022**

As part of a small development team, I contributed to Vismo Secure Portal, an ASP.NET Core intranet application that enables subscribed clients to track employee locations via mobile and GSM devices with role-based access controls. The platform enables clients to configure geofences, custom alerts, and user-group permissions for granular field operations management.

I also worked on the Event Processor, an Azure Function app that processes smartphone and GSM device data.
The team was gradually adopting a modular and microservice architecture, using separate modules for location, geodata and events, alerts. Each module was packaged as a NuGet library with dedicated ASP.NET Core Web APIs,

Event Processor (Azure Event Hub/SQL Server/Function App/C#)

- Contributed to wellbeing check module which was used during COVID-19 pandemic
- Built initial license validation module with feature gating based on subscription tiers
- Added new event types, improved existing logic and resolved bugs.
- Refactored and adjusted codebase to align with updated module contracts

Secure Portal App (ASP.NET Core/React/Typescript)

- Implemented new configuration modules
- Resolved responsive UI issues across mobile/desktop resolutions
- Performed ETL operations for importing geodata using C#, LINQPad, and SQL scripts
- Triaged and troubleshooted issues reported by customers.

Locate & Protect App (Xamarin .NET)

- Assisted team with debugging location reporting issues
- Verified data sync between mobile app and Secure Portal

Education

Engineering of IT Systems, University of Warmia and Mazury in Olsztyn, Poland **2015 - 2019**
